

Hello,

And thank you for your effort. It is much better but your new approach shows still shortages and you still don't understand the purpose of a prototype. Let me explain.

1. Learn to create and use a Rapid Prototype (https://en.wikipedia.org/wiki/Software_prototyping) in software development.
 - a. a prototype simulates only (no business logic)
 - b. shows a proposal of the final design
 - c. shows the workflow of the links
 - d. let you test what the user should do with your software
 - e. its a iterative process. You start rapid (quick and dirty) and change until it meets your requirements.
 - f. This means: you don't have precise requirements in the first place but play around and change. Since it is a mockup you don't spent much time and money.
2. What are your shortages?
 - a. You did not test ALL buttons or links. In header and footer of Hookpage many links are 404. Test and click on all and see what your system is doing. If correct be happy – if wrong ... change. Once done in hookpage copy the section and make a global replace for all files. (in Dreamweaver it is done easy). If you have no html create a blank page with the topic as header.
 - b. The logo is just to replace in 5 sec. but you did not do it. It means you still don't understand that the prototype should show a final design. Revise
 - c. I want you to learn how to find and meet development objectives yourself. I am not your customer or boss you have to follow. We are a team – you are my partner. Make changes by objectives and explain and I will follow you.
 - d. Read and learn the business model of Qix again. If you don't understand yet we schedule a zoom meeting and I explain. You need to implement our business model into the user interface. What are our services and products? This is what our website is about to present and promote.
 - e. As a result We are not a book store website ... we are a book publisher. Even if we use blind text change in a second the header of section to let us see and feel the direction we are going. It means we are not focused on selling books now (section "Books on Sale" or "Special Offers")) but we try to engage readers to become attached to authors and their manuscripts. I would change "Books on Sale" into "Freshly crafted manuscripts". But don't worry, this is my job. I just want you to understand.
 - f. What is more important to understand that in this early stage as long we don't sell books there is no "Add to cart" and no price. We need to match this funktion to our needs "Add to read" and instead of the price we show symbols like number of views, when created ("6 month ago") with and star with number (for rating like in fiverr)
 - g. Always get inspiration from similar websites like Fiverr, Youtube, Amazon Books, and www.penguinrandomhouse.com . Don't be afraid to copy. Learn from the best ...

I also made mistakes”

1. My image Qix PlatformReader was confusing you. I am sorry. You did the submenus for account correct but they don't make much sense. Still this is prototyping. In all sites change account to “profile”.
2. I will provide a new structure and design for profile today.
3. I need to provide a explanation how to use the images. Again you did good. My fault.
4. I will upload all the html templates we have for your use if a page is missing.

Next tasks:

- A. Adjust reader as discussed
- B. Continue with the other sites
- C. Please get 2 of your friends for the following coding in VS2022 C# Blazer. I will code some simple MudBlazer templates and teach on Zoom video how to put html into Blazer using ChatGPT without coding by copy and paste.
- D. Next I will provide a Blazer framework for our server application where we start to add these Blazor pages of C.
- E. Next I will teach you how to build microservices in C#.
- F. Finally you and your friends will learn how to setup and run Azure.

Maybe you can talk to your teacher at the university to create a project.
